

Annual National Accounts of Lesotho 2009-2018

The National Accounts are used to estimate the Gross Domestic Product (GDP), which measures the total value of all goods and services produced within an economy during a certain period of time. This Statistical Report therefore presents a brief overview of the performance of Lesotho's economy during the period 2009-2018, showing the annual GDP estimates from the production approach at current and constant 2012 prices. The compilation of estimates is done in accordance with international standards contained in the System of National Accounts (SNA), in particular SNA 2008 after the revision and ISIC REV4 is also adopted.

Presented in this publication are the 2018 annual estimates indicating main tables: GDP by activity; GDP by expenditure; and main national accounts aggregates. Revised estimates of GDP by activity are available back to 1982 on the website of the Bureau of Statistics in an Excel file for download.

Bureau of Statistics
PO Box 455, Maseru 100, Lesotho

Figure 5: GDP Growth Rates	16

Figure 1 shows GDP growth rates for the years 2009 through 2018. The performance of Lesotho's economy has been fluctuating for the past seven years from 2009 to 2016, with contraction in the latest two years. Real GDP is estimated at M23, 554 million in 2018 as the economy continues to contract, representing a 0.5 percent decline in GDP growth rate, and the lowest to be recorded in the past 10 years was 2017 with a decline of 1.3. The average annual growth rate of GDP has been 3.4 percent for the last ten years, during which the highest growth was observed in 2010 and 2012 with growths of 6.7 percent each. The drop in 2018 was due to poor performance of Agriculture industry, mainly farming of animals and growing of crops, market gardening and horticulture.

The decline in agriculture (20.0 percent) was caused by drought, which led to slaughters of farming animals and as a result, this affected growing of crops, market gardening and horticulture. The results of the severe drought in Agriculture had an impact on Manufacturing of food products and beverages with a drop from a growth rate of 25.3 percent in 2017 to 1.0 percent in 2018. In addition, wholesale and retail trade registered a 10.1 percent decline that is associated with the decline in manufacturing of food products and beverages. This drop in turn has a spill over in accommodation and food services, which declined by 9.5 percent. Other manufacturing as well as administrative and support services recorded declines of 8.7 and 8.2 percent respectively. The main contributor to the decrease in manufacturing is attributed to a decline in manufacture of metal products which declined because of drop in construction of buildings.

Figure 1: GDP growth rates

The structure of GDP is depicted in **Figure 2**. The group of activities classified as service industries have been leading other activities in terms of contribution towards GDP for the past ten years, at an average of 54 percent. These include Wholesale and Retail Trade, Hotels and Restaurants, Transport and Communication, Financial Intermediation, Real estate activities, Public Administration and other government service activities. Manufacturing and Mining and Quarrying follow marginally with an average of 20 percent over the same period while Agriculture continues to be the least contributing industry hovering at an average of 5 percent as it has done in the recent years

Figure 2: Structure of GDP

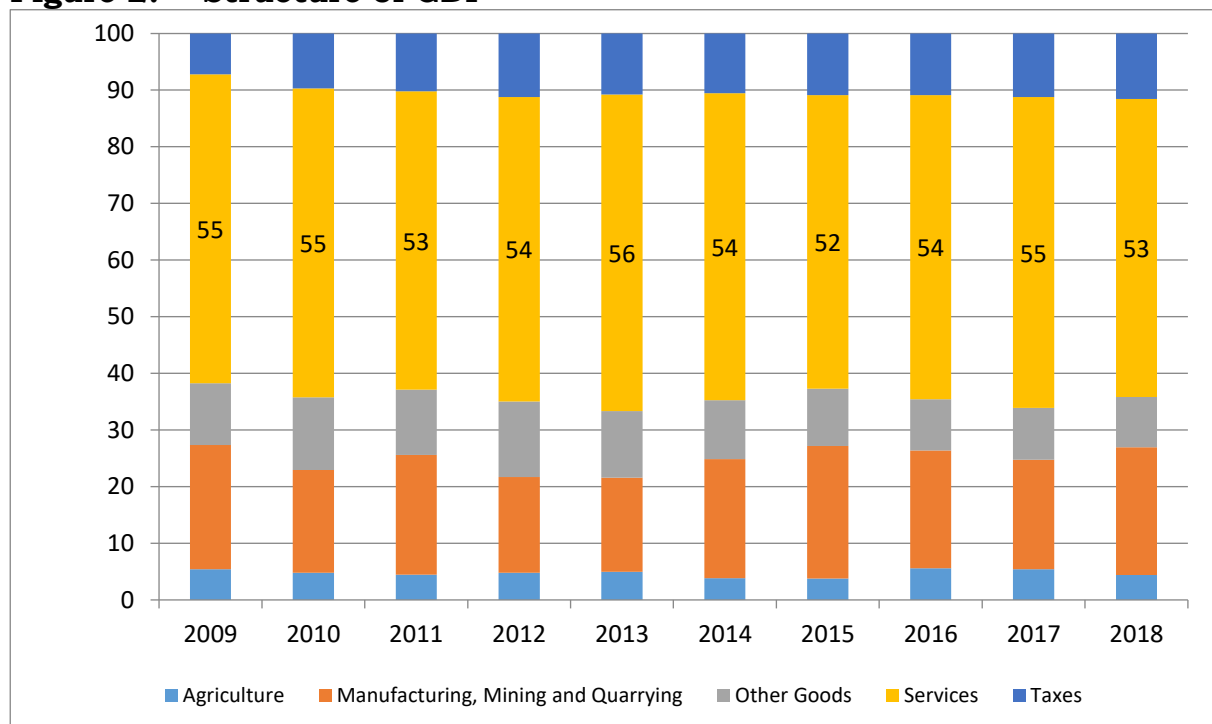

Figure 3 illustrates the growth of GDP and the expenditure items. GDP by expenditure approach comprises Final Consumption Expenditure (FCE), Gross Fixed Capital Formation (GFCF), Changes in Inventories and Net Exports of goods and services. The FCE components include Government and Private consumption, which covers Households and Non Profit Institutions Serving Households (NPISH).

Final Consumption Expenditure of government increased by 0.7 percent while that of households contracted by 8.9 percent in 2018. In the same year, Household Final Consumption Expenditure (HFCE) at current prices was estimated at M25, 081 million in 2018, representing 73.6 percent of GDP as compared to 77.0 percent in 2017. At an average growth rate of 7.5 percent over the past ten years, Final Consumption Expenditure of Non-Profit Institutions Serving Households (NPISH) was estimated at M562 million in 2018 while in 2017, it was M419 million. The percentage contribution of NPISH during 2018 was estimated at 1.6 percent, the highest since 2009. The Gross Fixed Capital Formation (GFCF) grew slowly in 2018 (2.5 percent following 2.7 percent in 2017). GFCF recorded a share of 26.7 percent during the year under review.

The increasing value of merchandise imports coupled with declining value of the counterpart exports worsened the trade deficit. In 2018, exports of goods and services were estimated at M16,951 million while the imports were M31,813 million. As compared to the other expenditure items (exports, government consumption and GFCF), imports contributed the most to GDP by expenditure. The consumption patterns for imports and private sector was above 80 percent while for the three remaining components was below 50 percent for all the years except for 2018 where the exports were slightly above 50 percent.

Figure 3: GDP by expenditure at constant prices, GDP 2012 = 100

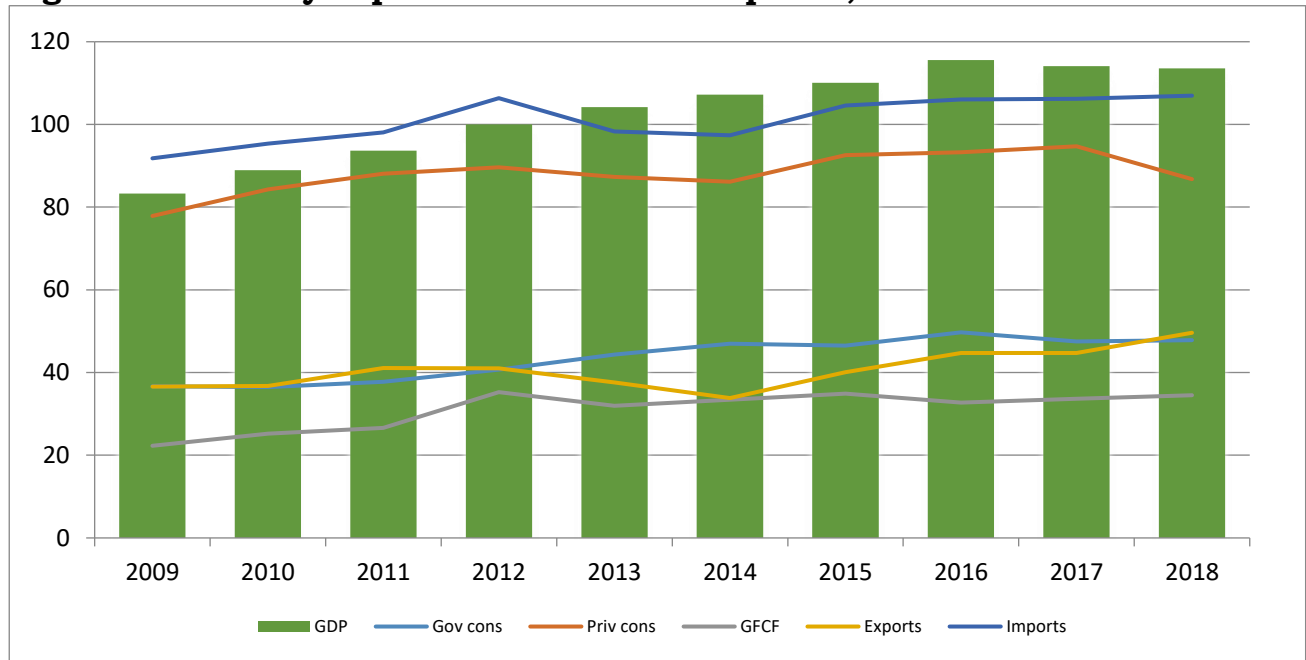

Figure 4 portrays the comparison between GDP and GNI, and the annual growth rates at constant prices are shown on the left axis. The findings show that from 2009 to 2012, the performance of GNI has been lower than that of GDP. However, there has been a noticeable growth of GNI from 2013 to 2015. The right axis shows the increasing ratio of GDP over GNI (current prices) between the period 2009 (76 percent) and 2014 (90 per cent). The ratio has however declined to 89 percent in 2016 and remained constant for the two consecutive years until 2018.

Figure 4: GDP and GNI (left axis: annual growth, right axis: ratio GDP/GNI)

Revisions

The accuracy of National Accounts estimates depends on timely revisions to data on GDP and its components. Thus National Accounts have to be revised over a number of years since data sources are always changing and improving. The time series must be suitably adjusted in order to reveal the best possible outcomes of the series in question over a long period. Such revisions are however usually small and done mainly to improve the results when new evidence become available.

The length of time series shown will depend on a number of factors. In general, comparison over many years need to be interpreted carefully in response to innovations in products, the growth of the economy over a long period, marketing strategies and changing import patterns. In addition, Lesotho adopted new methodologies, as a result, there were some changes in GDP growth rates back to 2007.

The estimates came up with revisions, more specifically on government activities and Financial Intermediation Services Indirectly Measured (FISIM). Based on new and disaggregated information received, all government activities that were estimated in other industries have now been removed and allocated to the Public Administration. Furthermore, estimation of consumption of fixed capital has been improved. This has resulted in revisions in Agriculture (Agricultural and Animal Husbandry service activities and Forestry); Water and Sewerage; Construction; Public Administration, Education and Health industries. Professional, Scientific and Technical activities as well as other Personal service activities were subsequently affected by changes in the calculation of FISIM. With updated information on Mining of diamonds, changes from 2013 can be observed in this industry. Further revisions can be expected in the coming periods when more data becomes available to enable deflation of the Public Administration.

Tables 8 and 9 present revisions of Value Added for each industry and GDP from 2007 to 2018 for both current and constant prices. The revisions are mainly based on additional information received during the year as mentioned; and slight changes in methodology due to availability of such data. In addition, BOS undertook a data quality check on the compilation system.

Figure 5 presents the difference in growth rates between the 2017 and 2018 publications, that is pre and post above-mentioned revisions. The two graphs follow almost the same pattern but different magnitudes. However, there was an exception in movement in the year 2011 where growth rates for 2018 publication show a slow growth of 6.1 percent whereas 2017 publication growth rates showed an increase of 6.9 percent.
