**Ministry of Finance and Development Planning
Bureau of Statistic**

Statistical Yearbook 2008

Preface

The Statistical Yearbook 2008 is the first Yearbook in many years, after the Bureau of Statistics decided to revive this publication, which was compiled and released fairly regularly until 1996 but then discontinued. The intention of the Yearbook is to put together available statistics produced by the Bureau and other institutions, thus providing a comprehensive set of statistics for Lesotho in one publication.

Statistics are presented in 15 thematic chapters, A-O. When available and appropriate, the tables contain time series of up to ten years are contained. Each chapter begins with one or two pages of comments and graphs, which are meant to highlight and explain some of the facts contained in the tables.

The intention is now to update and modify the Yearbook annually. In our quest to improve on the Yearbook and the statistics produced by the Bureau, we welcome suggestions and critique from our users.

The Bureau acknowledges the continued cooperation of government ministries, business enterprises and other private organisations that have contributed data to the Yearbook.

Liengoane Lefosa
Director of the Bureau of Statistics
April 2009

Table of Contents

A.	Geography and Climate	1
B.	Population.....	7
C.	Tourism.....	15
D.	Agriculture, Forestry and Fishing.....	19
E.	Industry and Electricity	27
F.	Transport and Communication	31
G.	National Accounts	37
H.	External Sector	43
I.	Public Finance	51
J.	Money and Banking	57
K.	Prices	61
L.	Labour Market.....	65
M.	Education	71
N.	Health and Medical Care	75
O.	Crime and Correctional Services.....	79

Symbols and Conventions

- Data not available
- Nil; equal to zero
- 0 Less than 0.5 but greater than zero
- 0.0 Less than 0.05 but greater than zero

More Statistics

The Bureau produces and publishes more detailed statistics on subject matter areas in this Yearbook. This is available from the Bureau's website:

www.bos.gov.ls

The Yearbook is available for download from the website as well as all the tables in Excel files.

A. Geography and Climate

List of tables

Table A.1 Some basic geographical facts	3
Table A.2 Lesotho districts.....	3
Table A.3 Agro-ecological zones	3
Table A.4 Rainfall, mm – 2000-2007.....	3
Table A.5a Rainfall, mm – 2006.....	4
Table A.5b Rainfall, mm – 2007.....	4
Table A.5c Rainfall, mm – 2008.....	4
Table A.6a Average maximum temperature, °C – 2006	5
Table A.6b Average maximum temperature, °C – 2007	5
Table A.6c Average maximum temperature, °C – 2008	5
Table A.7a Average minimum temperature, °C – 2006	6
Table A.7b Average minimum temperature, °C – 2007	6
Table A.7c Average minimum temperature, °C – 2008	6

Some basic facts (Table A.1)

Lesotho is a country in Southern Africa, located at around 29°30' south latitude and 28°30' east longitude. It is the 141st largest country in the world, with a total land area of 30,355 square kilometres. Lesotho is completely surrounded by South Africa, making it one of only three countries in the world that are enclaves within another country; the other two are San Marino and Vatican City, both located within Italy. The total length of the South African border is 909 kilometres. Lesotho's status as an enclave also means that it is landlocked and largely dependent on South Africa. The nearest major shipping port is Durban in South Africa.

The most notable geographic fact about Lesotho, apart from its status as an enclave, is that it is the only independent state in the world that lies entirely at altitude of 1,000 metres (3,300 ft) above sea level. Its lowest point is at 1,388 metres (4,600 ft), the highest lowest point of any country.

Administrative areas (Table A.2)

Lesotho is divided into 10 administrative districts, each with its own capital. The districts are further subdivided into 80 constituencies and 129 local community councils. The district towns have the same name as the district itself with three exceptions: Leribe, where the capital is Hlotse; Berea, where the capital is Teyateyaneng; and Quthing, where the capital is also known as Moyeni.

Besides the district towns, there are two more gazetted towns in Lesotho, namely Maputsoe in Leribe district and Semonkong in Maseru district.

Agro-ecological zones (Table A.3)

Lesotho comprises four distinct agro-ecological zones: Lowland, Foothill, Mountain and Senqu River Valley. These zones are characterised by significant climatic and ecological differences:

- **Lowlands:** Characterized by relatively high rainfall and allows cultivation of maize, sorghum, beans, winter wheat and vegetables. The soil is susceptible to erosion especially by wind or flowing water.
- **Foothills:** Lower rainfall compared to the lowland zone. It rises from 1800 to 2400 meters above sea level. The loose sandy topsoil is easily eroded by wind and rainwater due to over-grazing. Maize, sorghum and summer peas are growing in this zone.

- **Mountains:** Characterized by very cold winters. It rises to elevation of 3500 meters and constitutes by far the largest, and yet the least densely populated portion of the country. Livestock is commonly found in this zone. Wheat and peas are grown in this zone. Communication facilities are very poor in most of the mountain areas.

- **Senqu River Valley:** This is a steep along the Senqu River Valley, which runs from east to west across the country. The valley is characterized by a low rainfall especially in the south-western portion and by its rich soil along the banks of the Senqu River. Winter wheat and maize are grown in this valley. Much of the valley floor is cultivated while valley sides provide grazing.

Climate (Table A.4-6)

Due to its altitude, the country remains cooler throughout the year than most other regions at the same latitude. Lesotho has a temperate climate, with hot summers and cold winters. Maseru and its surrounding lowlands often reach 30°C in the summer. Winters can be cold with the lowlands getting down to -7° C and the highlands to -18° C at times. The mean summer temperature is about 25° C and the mean winter temperate about 15° C.

The yearly precipitation varies between about 600 millimetres in the lowland valleys to about 1200 millimetres in areas of the northern and eastern escarpment bordering South Africa. The annual mean precipitation for the country is in between 700 and 800 millimetres. Most of the rain falls as summer thunderstorms: 85% of the annual precipitation falls between the months of October and April. The winters – between May and September – are usually relatively dry. Snow is common between May and September; the higher peaks can experience snowfall year-round. There is much yearly variance in the amounts of rainfall, which leads to periodic droughts.

About the statistics

The first population census of Lesotho was undertaken in 1875. Subsequent censuses were carried out at irregular intervals until a programme of a decennial census was adopted in 1936. Since then, censuses have been conducted regularly in 1946, 1956, etc. with the most recent one in 2006.

The censuses prior to 1966 did not apply modern scientific methods of data collection although some improvements were introduced in the 1956 census. Earlier censuses used the assembly method or simply rough estimates of the total population, in some cases the combination of both methods.

Since independence in 1966, the government of Lesotho, through the Bureau of Statistics, has successfully conducted five modern population censuses. The latest one was carried out in April 2006.

The population censuses in Lesotho count all usual residents of the country, the *de jure* population and all persons present in the country, the *de facto* population.

The numbers from the 2006 Census presented here are still preliminary. Thus, data on the *de facto* population are not yet available

Summary of censuses (Table B.1-2)

The *de jure* population of Lesotho was about four times bigger in 2006 compared to 1911, when the *de jure* population was counted for the first time. The intercensal growth rates □ the annual average growth between two censuses □ has fluctuated as shown in Figure B.1.

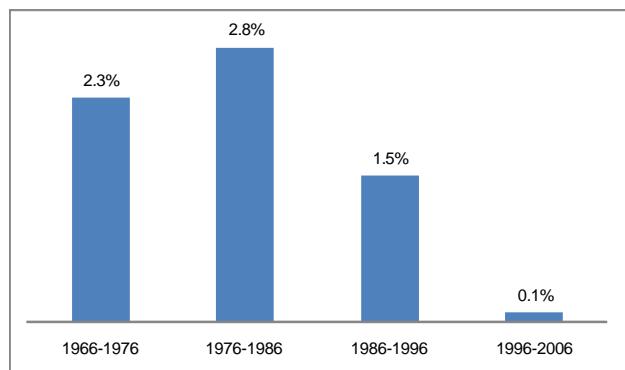

Figure B.1 Intercensal annual growth rates

The generally low rates for the period 1921-1956 could be explained partly by the method of enumeration, the great depression in the 1930s and the Second World War. After 1956 the annual growth rate increased to reach 2.6% from 1976 to 1986. The declining growth rate thereafter □ only

0.1% 1996-2006 □ are due to changes in fertility, mortality and migration as well as to the HIV/AIDS pandemic.

The *de facto* population has always been significantly lower than the *de jure* population because of migrant Basotho workers in South Africa.

Population by residency (Table B.2-5)

Fifty-five per cent of the population live in the lowland zone. This has increased from about 46% in 1976, while the share of the foothill zone has decreased from 23 to 13%. The percentage living in the mountain zone has been fairly stable at about 20%. This is also the case for the Senqu River Valley zone, where the population has fluctuated between 11 and 13%.

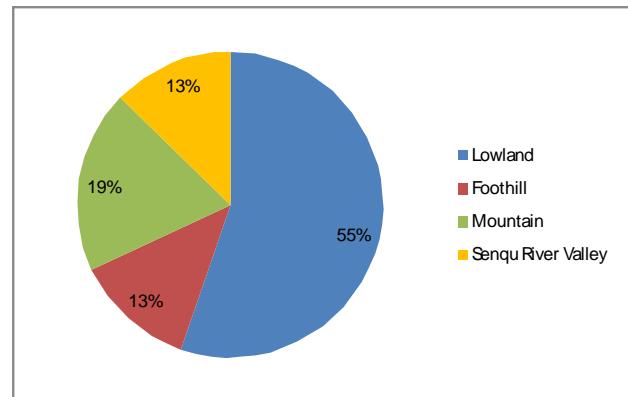

Figure B.2 Population by agro-ecological zone 2006

Maseru is the most populous district with close to one quarter of the population as illustrated in Figure B.3. The least populous district, on the other hand, is Qacha's Nek with about four per cent of the population.

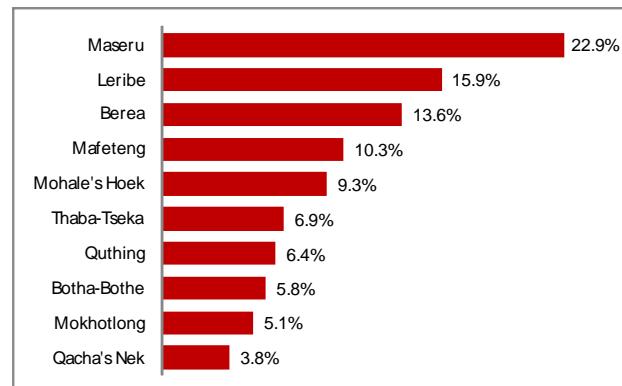

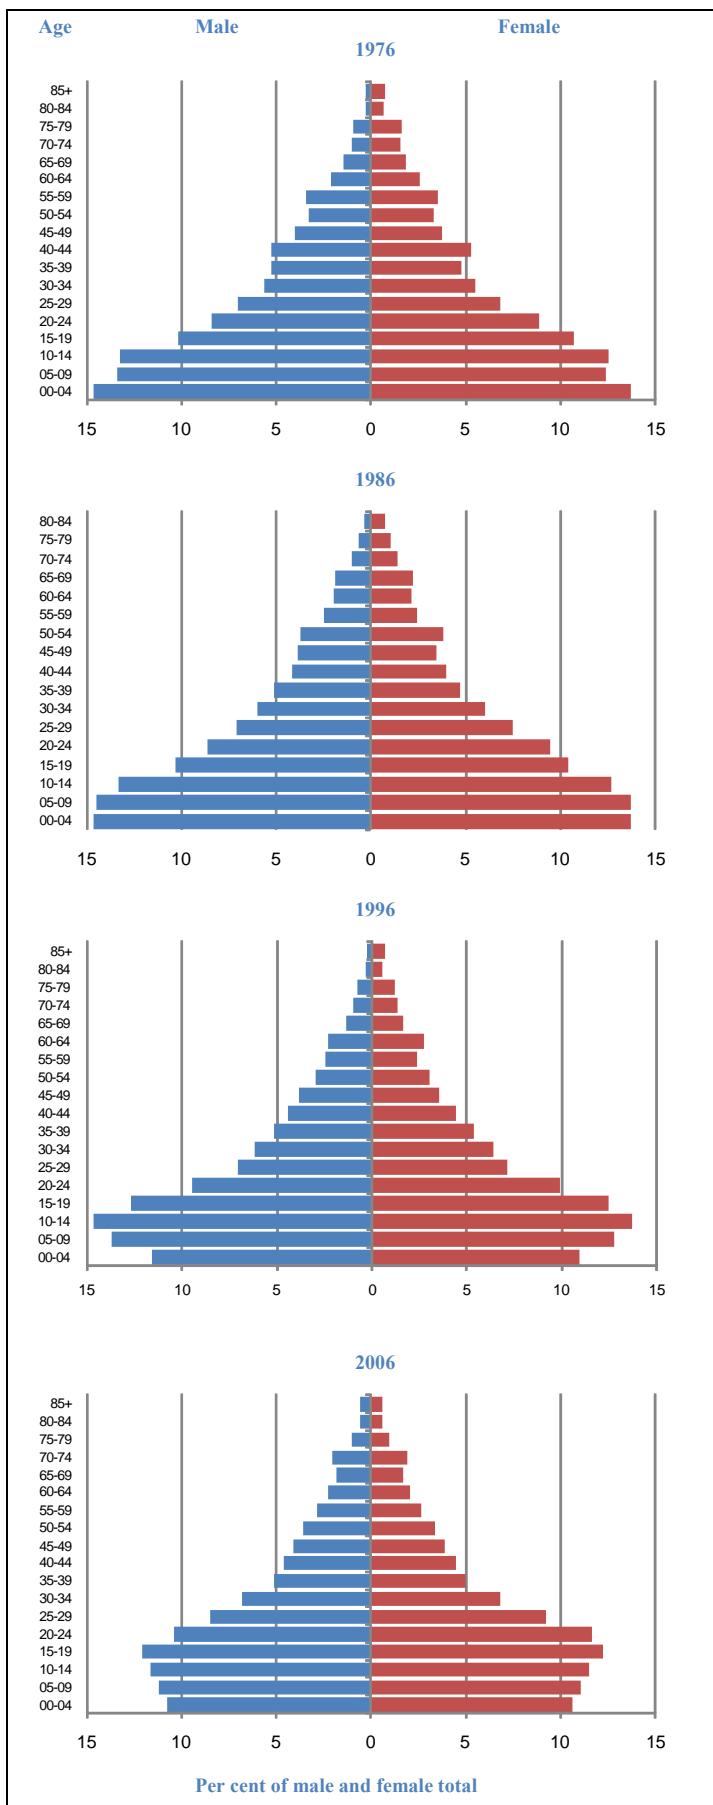

Figure B.3 Population by district 2006

The district of Thaba Tseka was created in 1980 by joining areas out of the following districts: Maseru, Berea, Qacha's Nek and Mokhotlong.

The urban population in Lesotho is relatively low, close to one quarter of the population in 2006. This has increased from 17% in 1996 and 11% in 1986. See Table B.5. As urban areas are defined by legal declarations, the data are not entirely comparative from census to census.

Population by age and sex (Table B.6)

Population pyramids for the four censuses from 1976 are shown in Figure B.4. The pyramids show percentage shares for five-year cohorts of males and females; for example close to 15% of all males were below five years of age in 1976; only 11% were in this age group in 2006.

The pyramids expose significant changes in the age structure of the population, in particular since 1986. The shrinking base of the pyramid reflects the net effect of declining birth rates since the early 1990s and the rising death rates due to the AIDS pandemic. The changing age structure also suggests a trend towards ageing of the population

Table 6 does not include the actual numbers for 2006 as these still need to be finalised. However, the shape of the pyramid will by and large be the same as presented here.

Population by detailed areas (Table B.7-8)

Table B.7 and 8 show population in the 80 constituencies (B.7) and the 129 local community councils (B.8). The constituencies vary in population from 17,122 (Malimong in the Berea district) to 37,669 (Mabote in the Maseru district).

The data for the community councils exclude population in institutions, for example prisons. Close to 8,000 persons lived in institutions when the census was taken, nearly 4,500 male and about 3,500 female.

	Female	67 787	93 407	60 165	121 922
	Total	129 254	180 719	115 986	237 672
Lesotho	Male	587 348	784 688	910 025	916 282
	Female	629 467	820 401	952 250	964 379
	Total	1 216 815	1 605 089	1 862 275	1 880 661

Note: The allocation of the population to agro-ecological zones is out of line for 1996.

Areas that should be in Senqu River Valley zone seem to have been allocated to the mountain zone. To a lesser extent this could also be the case for the foothill zone.

Table C.8 Number of available beds and bed-nights sold by district □ 2006	17

About the statistics

Tourism statistics are based on the entry forms collected at border posts by the Ministry of Home Affairs, Department of Immigration. The Lesotho Tourism Development Corporation and the Bureau of Statistics are the agencies responsible for compiling these data. Only entry forms for persons who are not citizens of Lesotho are processed. Data were not collected for a number of years. Data collection resumed in 2003 but was incomplete for 2004 and 2005. Hence, the tables include only 2006 and 2007.

Data on accommodation are collected by the Lesotho Tourism Development Corporation from accommodation establishments around the country. These data are available from 2005 on a quarterly basis. Because of non-responses, however, the data are not entirely comparable from quarter to quarter.

Tourist arrivals (Table C.1-4)

An international tourist is defined as a visitor who enters a certain country to stay for at least one day regardless of the purpose of the visit. Thus, returning residents – less than one per cent of all entries – should strictly speaking not be considered as tourists or visitors.

About 95% of all visitors enter Lesotho by road through one of the many border posts around the country, which are indicated in Figure 1.

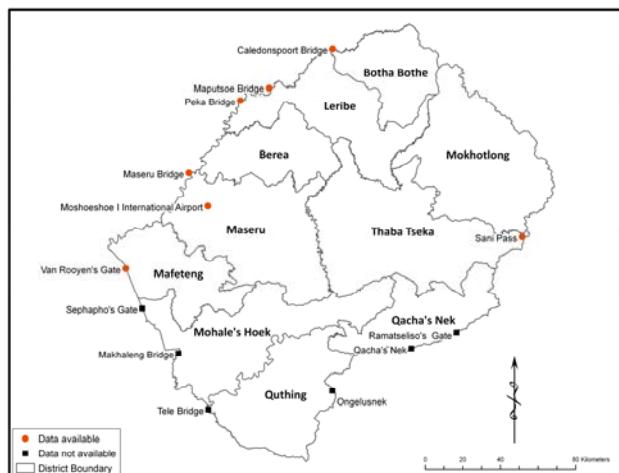

Figure C.1 Border posts

The major border posts are Maseru Bridge and two ports to the north of Maseru, namely Maputsoe and Caledonspoort. These three border posts account for about 80 per cent of all visitors. The main port to the south is Van Rooyens gate close to Mafeteng. Sani Pass on the eastern escarpment attracts holiday makers, many of them day visitors. Note that

some of the border posts are not included in the tables. They are all fairly small in terms of entering visitors.

The number of reporting visitors decreased with more than 56 000 in 2007 compared to 2007. South African residents accounted for all of this decrease.

Following are some salient characteristics of visitors:

- About 60% are men.
- The most important purposes of the visit is either Holiday or Other (presumably visiting friends and family), together accounting for about 80%.
- 85 to 90% of the visitors are South African residents.
- About 50% of the visitors stay only for three days or less.

Accommodation (Table C.5-6)

Table C.5 shows the number of beds available, the number of bed-nights sold and the bed occupancy rate¹. The reported number of bed-nights sold was 144 254 in 2005 and 226 508 in 2006. This huge increase is due to that a number of establishments that were included in 2006 were not included in 2005. However, there have been new entrants in the industry since 2005.

The bed occupancy rate has varied between 15 and 21% with the rate being higher in the fourth quarter as can be expected.

Table C.6 shows the number of beds available and bed-nights sold by district for 2006. Maseru accounts for more than half of the bed-nights sold (54%) as illustrated in Figure C.2.

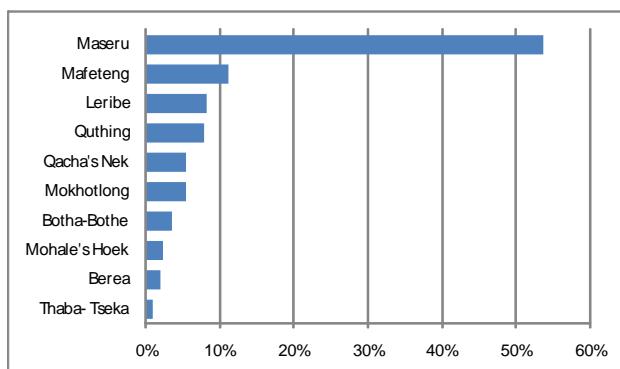

Figure C.2 Bed-nights sold 2006, percentage share

¹ Bed occupancy rate = number of bed-nights sold as a percentage of the number of beds multiplied by the number of days in a quarter.

Table D.9 Fishing, some basic data.....	25

About the statistics

Statistics on crops and livestock are derived from the annual agricultural production survey (APS), which runs over the agricultural year, from August to July. This is a sample survey using a stratified two-stage design with probabilities proportional to size. The estimates of crops are based on objective measurements of areas planted and harvested and of harvested quantities. Livestock numbers are gauged twice a year, in August and February. A separate survey is conducted for agriculture in urban areas.

In addition, the Bureau of Statistics compiles administrative data on livestock products.

Crops (Table D.1-3)

Five major crops are gauged in the APS: maize, sorghum, beans and peas. All of them are summer crops, i.e. planted in summer (October-December) and harvested in winter (May-July). In the Lowlands and Foothills zones wheat and peas are also grown as winter crops. Maize, being the staple food in Lesotho, is by far the most important crop accounting for 60-65% of the area planted.

The production and area planted have varied significantly since 1997/98, affected by unfavourable weather conditions since 2001/02, in particular by the severe drought in 2006/07. Figure D.1-4 illustrates the development since 1997/98 of the three grain crops: maize, sorghum and wheat.

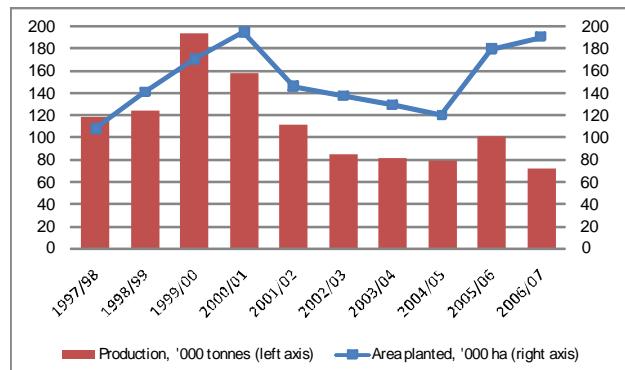

Figure D.1 Maize, production and area planted

The production of maize reached a peak in 1999/2000 with 194,000 tonnes harvested and an average yield of 1,142 kilograms per hectare. In the drought year 2006/07 the average yield was only 381 kilograms per hectare.

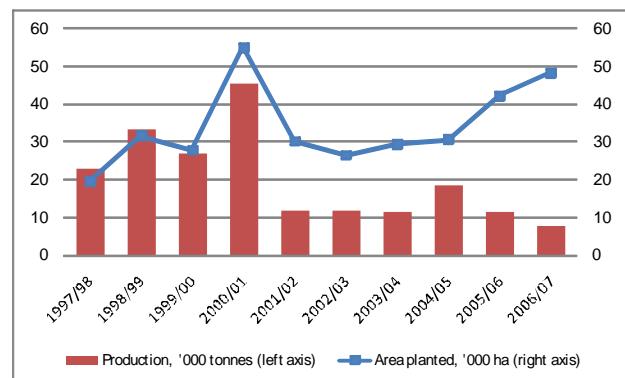

Figure D.2 Sorghum, production and area planted

The production of sorghum peaked in 1999/2000 with 45,000 tonnes, while the average yield has been sliding downwards from a high 1,176 tonnes per hectare. In the drought year 2006/07 the average yield was only 162 kilograms per hectare.

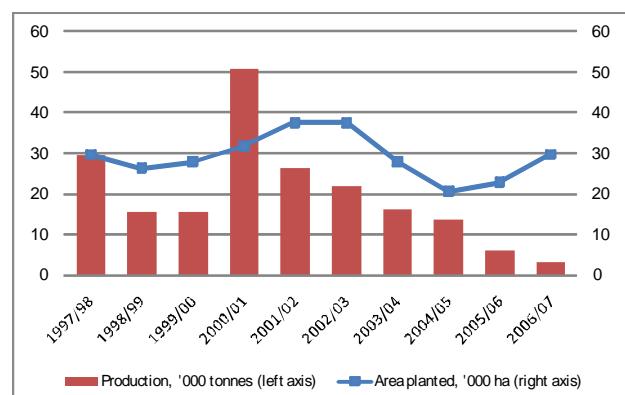

Figure D.3 Wheat, production and area planted

Wheat production reached a peak in 2000/01 with a production of 51,000 tonnes and an average yield 1,600 kilograms per hectare. The harvest of the drought year 2006/07 was close to a complete failure with an average yield of only 39 kilograms.

In summary, there are some common features of the development of the three grain crops during the ten year period 1997/98-2006/07: The production reached a peak in 1999/00 or 2000/01 and has after that been significantly lower.

The area planted increased during four or five years after 1997/98, then decreased for three to four years. The increase in area planted in 2005/06 and 2006/07 did not result in higher production. There was a severe drought in 2006/07 with a crop failure as a result. Figure D.4 shows the development of the average yield.

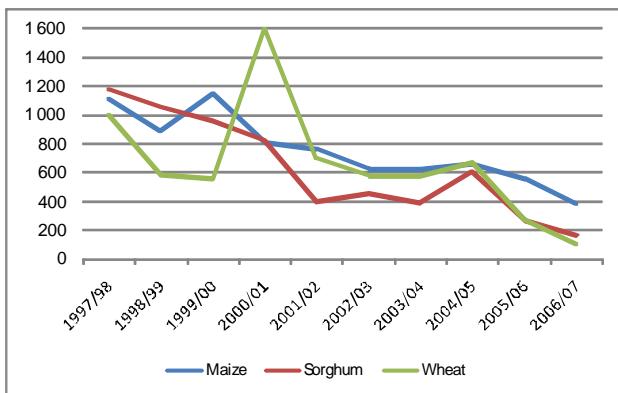

Figure D.4 Grain crops, average yield, kilograms

Livestock (Table D.4-6)

Domestic animals are very important to the Basotho. They provide food and non-food products, both commercial and for own consumption: meat; milk; hides and skins; eggs; wool and mohair. Animals are also used for transport □ horses are important in the mountainous terrain □ as well as for security and leisure. Most animals are a source of natural fertilizer and fuel. Most importantly, they are an indication of wealth. Cattle are also for paying lobola (bride price), which is a prestigious occasion in Basotho tradition.

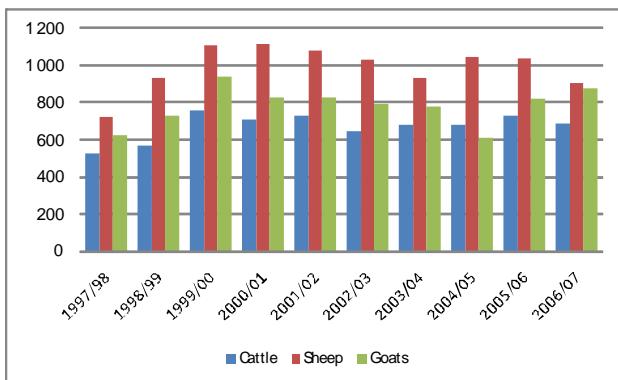

Figure D.5 Number cattle, sheep and goats

Table D.4-6 and Figure D.5 show livestock numbers as measured in August every year. Herd sizes increased over the three years 1997/98-1999/2000 and have been fairly stable ever since. Approximately, the average herd size since 1997/98 has been 700,000 for cattle, 1,000,000 for sheep and 800,000 for goats.

Livestock products (Table D.7)

Important livestock products include meat, milk, wool and mohair.

- **Meat.** The number of slaughtered animals gives an indication of quantities of meat produced. Since the closure of the National Abattoir and Feedlot in 1997, animals are slaughtered mainly for home consumption.
- **Milk.** The major part of milk produced by farmers is used for home consumption. However, there is also commercial production of raw milk for delivery to Lesotho Dairy Products as shown in Table D.7; raw milk is also imported by the Dairy to cater for shortfalls in domestic supply.
- **Wool and mohair.** The production of wool and mohair is mainly for exports, while a minor part is used by local producers of tapestries and knitwear. The quantities produced have increased substantially over the last ten years, on average with 7.8 and 5.3% per year for mohair and wool respectively. See Figure D.6.

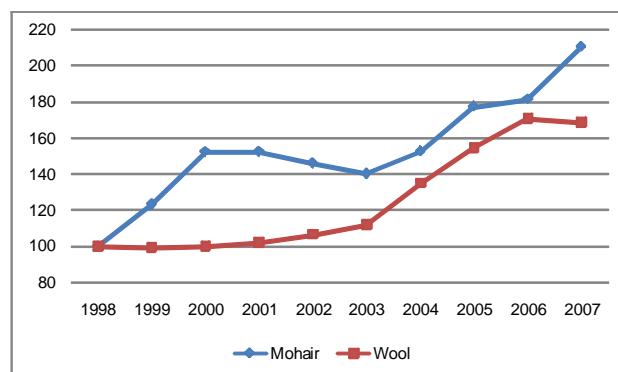

Figure D.6 Production of wool and mohair, 1998 = 100

Forestry (Table D.8)

Lesotho is one of the least forested countries in Africa. There are no recent and comprehensive data on the extent of the forest cover. Variations in estimates depend on the definition of forest employed. By the most favourable counts, and taking into account all types of forestry resources, the cover is only a few per cent of Lesotho's total area. The numbers presented in Table D.8 are approximate estimates. They indicate a slight increase in forest plantations over the years and an unabated destruction "other wooded land" such areas covered by shrubs.

The main role of the forest sector is not in traditional timber production but in the protection of soil and water resources. Although indigenous forests and shrub land are of low occurrence they constitute an important resource to rural communities by providing firewood, construction materials, medicine, forage and shelter.

Fishing (Table D.9)

Fishing and fish farming play a very insignificant role in the economy of Lesotho. Capture fishery as well as the rural aquaculture is of the subsistence type and their main role is in food security. However, cold water aquaculture has been introduced as a result of the Lesotho Highlands Water Project with a potential for becoming an important foreign exchange earner through exports of rainbow trout.

The data on captures provided in Table D.9 are approximate estimates.

E. Industry and Electricity

List of tables

Table E.1 Employment and earnings in manufacturing	28
Table E.2 Electricity, Gigawatt hours	29

About the statistics

The Bureau of Statistics conducts a survey of medium and large scale manufacturing, which includes all enterprises with 20 or more persons employed. The survey gauges the production volume, employment and earnings (the remuneration of employees). The methods for measuring the production volume are currently being reviewed. Therefore, this chapter includes only employment and earnings data.

As the survey has not covered all clothing and textile enterprises, additional data are used for that industry, namely employment data provided by the Lesotho National Development Corporation (LNDc).

Data on electricity are provided by the Lesotho Electricity Company (LEC) and the Lesotho Highlands Development Authority (LHDA).

Manufacturing (Table E.1)

Manufacturing in Lesotho is dominated by clothing and textiles. This sub-sector of manufacturing has expanded rapidly since 1999. A major part of the textiles and clothing is exported to the US as a result of preferential treatment under the African Growth and Opportunity Act. The sector was adversely affected by the removal of textile quotas in 2005, but managed to recover partially in 2006.

As illustrated in Figure E.1, the increased employment in manufacturing, as well as the decrease in 2005, is all because of the textiles and clothing sector.

The value added and earnings per worker is lower in textiles and clothing than in other sub-sectors of manufacturing. This is illustrated in Figure E.2. Whereas textiles and clothing accounted for 90% of manufacturing employment in 2007, its share of the value added by manufacturing was 73%. The corresponding shares for food and beverages were 2 and 16% respectively.

Electricity (Table E.2)

Lesotho has generated electricity on a large scale, since 2000 when the 'Muela plant started to operate. 'Muela was constructed as part of the Lesotho Highlands Water Project. Before 2000, LEC imported all electricity from South Africa before 2000, whereas today only a minor part is imported, mainly in winter.

List of tables

Table F.1 Imports of vehicles, numbers	32
Table F.2 Length of road network, kilometres	32
Table F.3 Road accidents	33
Table F.4 Air traffic.....	34
Table F.5 Telephone connections	35
Table F.6 Telephone traffic, thousand minutes	35

About the statistics

The tables in this chapter are all based on administrative data provided by the Ministry of Public Works and Transport and Telecom Lesotho. Vehicles are registered in the districts. However, data on registered vehicles have not been compiled in a comprehensive way for many years.

Vehicles and roads (Table F.1-2)

Vehicle imports stood at 1985 in 2003 and then increased in 2004 and 2005, to 2342 in the latter year. These imports decreased to 1872 in 2006.

The total length of the road network was the same during the years 2003-2005, although the length of paved roads increased slightly in 2004. In 2006, the total road network increased with 61 kilometres, while the paved roads increased with 111 km. The paved portion of the road network was then 57%.

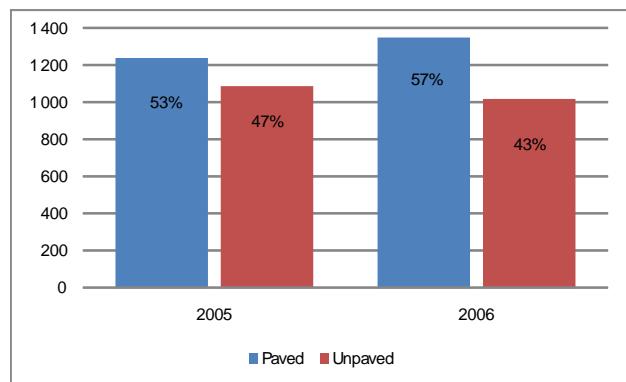

Figure F.1 Length of road network, kilometres

Road accidents (Table F.3)

The number of reported road accidents has fluctuated between 3400 and 3800 during the years 2003-2006. There has, however, been a decrease in fatalities as illustrated in Figure F.2

Air traffic (Table F.4)

Table F.4 includes traffic data for Moshoeshoe I International Airport. Domestic flights are mainly those operated by the Flying Doctors. International scheduled flights are operated by South African Airlink; the number of scheduled flights has roughly doubled from 2001 to 2007, when there were more than 2600 flights. Note, that the number of flights in a sense is double counted: An arriving flight is normally departing after picking up passengers; this is counted as two flights.

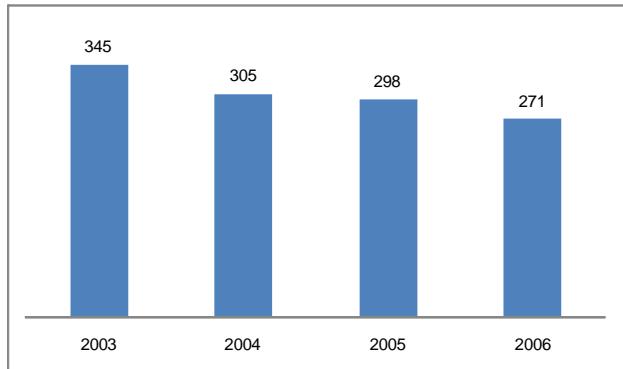

Figure F.2 Number of deaths in road accidents

Telephone traffic (Table F.5-6)

Available data comprise fixed telephones, i.e. Telecom Lesotho. The total number of customer lines has decreased slightly from 2003 to 2006, from about 36800 to about 35700. Out of this, the number of “traditional” copper lines was about 24800 at the end of 2006.

There has certainly been an expansion of cellular telephone traffic, but there are no comprehensive data available. However, an indication is given by Telecom’s data on call minutes to different destinations. Calls from fixed telephones to the two cellular networks have increased from about 5500 in the second quarter of 2003 to about 7500 in the first quarter of 2007. At the same time, national call minutes, from one fixed subscriber to another, decreased from about 18700 to about 12600.

About the statistics

Lesotho's national accounts are compiled according to international recommendations as laid in the 1993 System of National Accounts. The estimates have recently been revised in a major exercise. A variety of sources are used in the compilation of national accounts, for example statistics on agriculture, manufacturing, foreign trade and public finance. An important new source in the revised estimates is data on turnover collected in the VAT-system.

In order to measure the growth rates of national accounts variables, estimates are also provided at constant prices, i.e. at prices of a certain year, the base year. Thus, for example, GDP at constant prices measures the real development of the domestic economy. The base year has recently been updated to 2004.

Main aggregates (Table G.1-2)

The gross domestic product (GDP) is a measure of the result of production during a certain period (year, quarter) of corporations, household enterprises, government and non-profit institutions on Lesotho's economic territory. Basotho labour force and Basotho property, however, enter production abroad and foreign labour force and property enter production in Lesotho. The transfers of labour income and property income are recorded as primary income to and from the rest of the world. GDP plus net primary income from

abroad make up the gross national income (GNI). Gross National Disposable Income, finally, is derived by adding net transfers from the rest of the world to GNI. An important transfer for Lesotho is the SACU-revenue.

Lesotho's GNI is considerably larger than its GDP. This reflects the significance of the income of the migrant mine workers. However, the gap between the two measures has narrowed as the contribution of the migrant miners has decreased in relative importance; there has been a decrease of mining jobs in South Africa and, besides, it has become easier for Basotho workers to gain residence in that country.

Since 1982, GDP at constant prices has grown by 4.1% on average per year. The ten years from 1987 to 1997 showed a higher growth rate – 5.3% on average per year – mainly due to the Lesotho Highlands Water Project. The insignificant growth rates in 1998 and 1999 were partly due to the political unrest in 1998. From 2000, however the average annual growth rate has been 3.8%. See next page (GDP by activity) for more details.

Figure G.1 compares GDP and GNI. The annual growth rates at constant prices are shown on the left axis: GDP growth, on average 4.1% per year, has outpaced the annual average growth of GNI, 2.6%. The right axis shows the increasing ratio of GDP over GNI: 56% in 1982 compared to 79% in 2007.

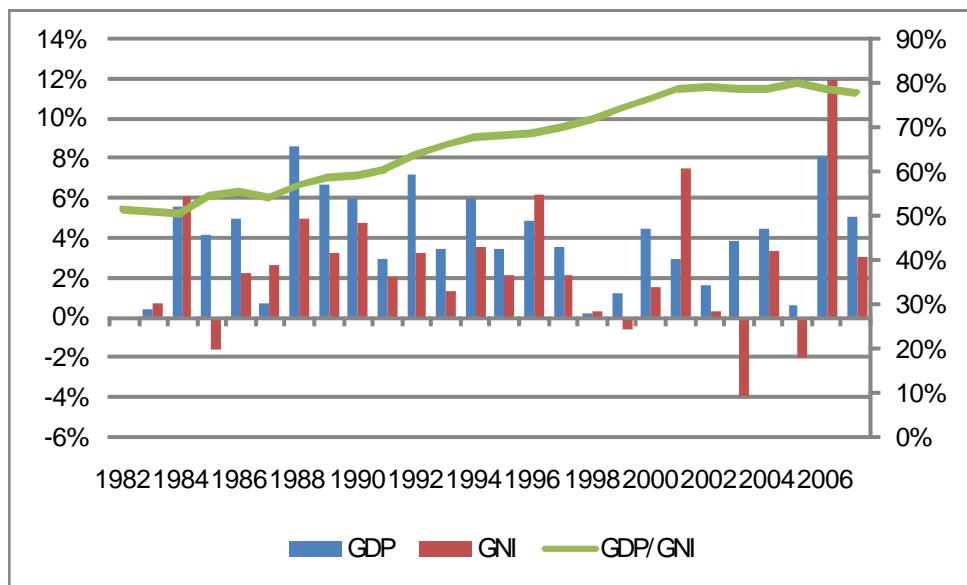

Figure G.1 GDP and GNI

GDP by activity (Table G.3-4)

GDP can be measured from the production side as the sum of the values added of all producers plus taxes on products (VAT, import and excise duties) and minus subsidies on products. The structure of GDP by activity has changed gradually over the last ten years with the contribution of agriculture decreasing from 11 to 7%, while the contribution of other goods producing industries² has increased significantly, from 22 to more than 32%. The contribution of the service industries has fluctuated between 55 and 60%. Figure G.2 shows the changing structure in a longer perspective, from 1982 to 2007. In 1982, the shares of agriculture and services were considerably larger. The reason for the relatively large contribution of electricity and water to GDP is the delivery of water from Lesotho Highlands Project. This project also had a significant impact on the contribution of construction to GDP; however, its share has decreased with the completion of the construction phase. The opening of two diamond mines in 2004 and 2005 is the reason behind the large increase in the contribution of mining.

The growth of GDP and major sectors are illustrated in Figure G.2. Agriculture is very much affected by weather conditions resulting in decreases for a number of years. The other goods producing industries have, in total, been growing at a steady rate. Manufacturing has been driven by the textiles and clothing industries, which were adversely affected by the removal of textile quotas in 2005 resulting in a decrease of manufacturing that year. However, the sector recovered in 2006. The opening of two diamond mines in 2004 and 2005 offset the decline of manufacturing.

Expenditure on GDP (Table G.5-6)

GDP can also be measured as the sum of final expenditure (final consumption, gross fixed capital formation, changes in inventories and exports) minus imports. Final consumption expenditure is incurred by government, households and non-profit institutions serving households (NPISH). The latter two are referred to as private consumption

Gross domestic expenditure (GDE) is made up of final consumption, gross fixed capital formation, and changes in inventories. Final consumption has gradually increased its share of GDE over the latest ten years, while the share of gross fixed capital formation has decreased its share. See Figure G.3.

About the statistics

Foreign trade statistics are based on the customs declaration forms collected by the Lesotho Revenue Authority complemented by other sources. The export forms are processed by the Central Bank, while the import forms are processed by the Bureau of Statistics.

The balance of payments is compiled by the Central Bank and is currently being reviewed and revised. However, it still remains to finalise the revisions; the version published here does therefore not include the revised data. Because of this, there are discrepancies between total exports and imports in Table 1-5 compared to Table 8.

Trade in goods (Table H.1-2)

There is a significant deficit in the trade of goods. However, the gap has narrowed due to the growth of exports of clothing and, for the latest four years, of diamonds. Exports of goods covered 20% of imports in 1998; ten years later that ratio was 46%.

Four commodities dominate exports of goods: clothing, diamonds, television sets, and footwear. This is illustrated in Figure H.2. Since 1999, these products have fluctuated between 86 and 92% of exports of goods; this share was 65% in 1998. The two most important export products, clothing and diamonds, have made up 60-85% in the latest four years. The net contribution of clothing is, of course, smaller; a major part of the inputs, mainly textiles, are imported.

Imports of goods in Table H.3 are classified according to Broad Economic Categories, which broadly categorizes goods according to their end use.

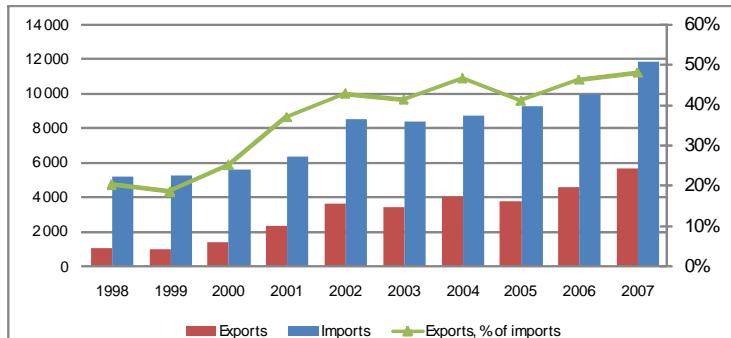

Figure H.1 Exports and imports of goods

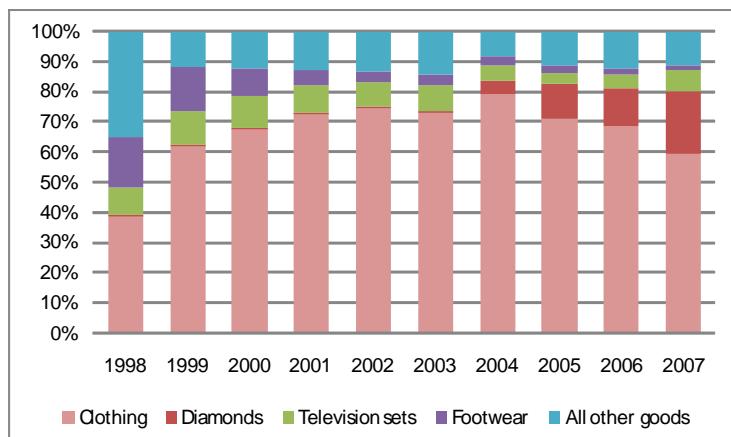

Figure H.2 Major export products

Direction of trade (Table H.3-4)

Lesotho is a member of the Southern African Customs Union (SACU). The other members are South Africa, Botswana, Namibia and Swaziland. A major part of Lesotho's imports come from South Africa; before 2000 it was normally 90% or more of imports. Since 2000, however, a significant share of imports originates in Asia. This is mainly textiles used as inputs by the clothing industry.

South Africa has historically been the major destination for Lesotho's exports. Since the emergence of clothing exports to the USA, however, that country is now a major exports destination. Furthermore, diamonds exports go to Belgium making the European Union another important destination.

Trade in services (Table H.4-5)

Two items dominate exports of services, water distribution services and travel, accounting for about 50 and 40% respectively of the total. The first is the royalties received by the Lesotho government as part of the Lesotho Highlands Water Project. Travel comprises expenditure by non-resident visitors to the country. This is sometimes used a proxy for tourism earnings.

Travel, i.e. expenditure by Lesotho residents abroad, make up in between 50 and 60% of imports of services. The other three important items are: transport, business services and government. The latter comprise expenditure by Lesotho embassies abroad.

Exports of clothing to the USA (Table H.8)

The major part – more than 70% – of Lesotho's clothing exports goes to the USA. Figure H.4 illustrates the development of values and volumes over the last ten years. In value terms (Maloti), the exports to the US peaked in 2002, while the exported volumes peaked in 2004. The dollar exchange rate reached a peak in 2002, which contributed to the high Maloti value that year.

The balance of payments (Table H.7)

The balance of the current account of the balance of payments has normally been negative. The balance of trade in goods and services has always shown a significant deficit. This is counterbalanced by surpluses for labour income, mainly migrant mine workers, and current transfers. Due to a windfall in the revenue from the SACU, which makes up the major part of current transfers, there was a surplus in the current account for the years 2006 and 2007.

Exchange rates (Table H.8)

The exchange rate for both US Dollar and Euro reached a peak in 2002, quite close to each other. Both rates, in particular the dollar declined after that. Since the beginning of 2008, however, the Loti has weakened against both currencies.

About the statistics

Government in Lesotho comprise, firstly, all ministries and departments, which are accounted for in detail in the government budget. Secondly, a number of government institutions are semi-autonomous and appear in the government budget as grants to extra-budgetary accounts. The same is true for local government, which is made up of the Maseru Municipality and 128 community councils. As the data in Table I.1-4 derive from the government budget, no details are provided for the extra-budgetary accounts and local government. These tables are recorded according to international guidelines provided in a manual called Government Finance Statistics. The format differs from previous presentations of budgetary operations.

Table I.5-6 present monetary statistics, which are compiled by the Central Bank of Lesotho.

Statement of government operations (Table I.1)

The operating balance equals revenue *minus* expenses. It is comparable to the concept of saving, and can be seen as a summary measure of the ongoing sustainability of government operations. It has been positive since 2000/01. Net acquisitions of non-financial assets, e.g. machinery, vehicles, buildings, are the same as gross fixed capital formation.

Net lending (+) / borrowing (-) equals operating balance *minus* net acquisitions of non-financial assets. It can be seen as a summary measure indicating the extent to which government is either putting financial resources at the disposal of other sectors in the economy or utilising the financial resources generated by other sectors. It may therefore be viewed as an indicator of the financial impact of government activity on the rest of the economy. This measure has been positive since 2003/04, i.e. there has been net lending.

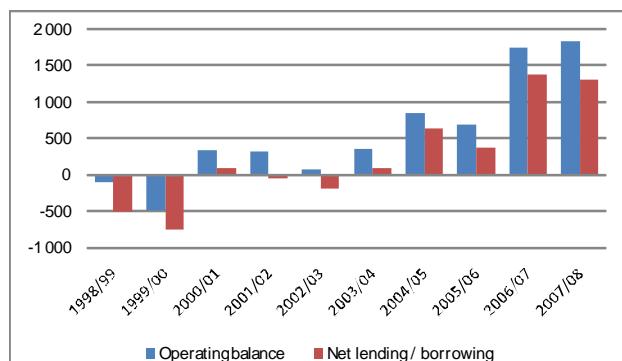

Figure I.1 Op. balance, net lending/borrowing, million M

Net lending/borrowing can also be measured as net acquisitions of financial assets *minus* net incurrence of liabilities. This is conceptually equal to the measurement described in the previous paragraph. Due to data imperfections, however, it is not; hence the statistical discrepancy.

Revenue and expense (Table I.2-3)

The revenue from the Southern African Customs Union makes up a substantial share of government revenue; it has fluctuated between 44 and 60% over the last ten years and was particularly high in the latest two years. See Figure I.2. The share of taxes has been fluctuating between 30 and 40%.

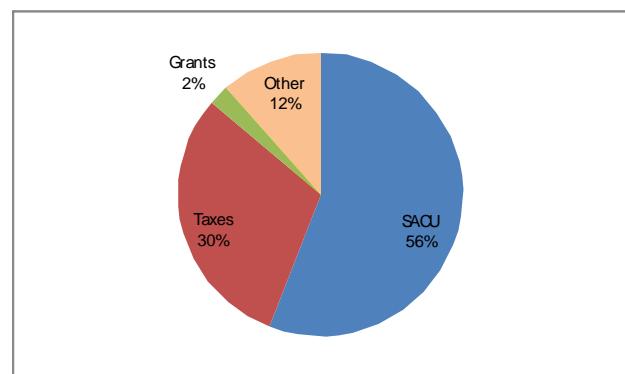

Figure I.2 Revenue shares 2007/08

Compensation of employees and use of goods and services have each made up about 35% of government expense during the latest three fiscal years. The ratio for interest payments has fluctuated around 5%. The remaining expense categories comprise transfers of different kinds.

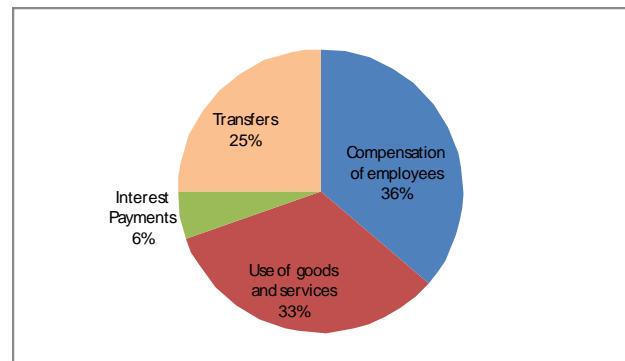

Figure I.3 Expense shares 2007/08

The sharp increase in social benefits in 2005/06 was due to the introduction of a general old age pension. Similarly, the

sharp increase in grants to local government in 2006/07 was because of the local government reform that was implemented that year. Local elections were held for the first time.

Changes in net worth (Table I.4)

Changes in net worth, can be calculated in two ways, namely: a) as revenue *minus* expense, i.e. it is equal to the operating balance (see above); and b) as the sum of its constituent parts, i.e. changes in financial assets *plus* changes in non-financial assets *minus* changes in liabilities. The two measures are the same in theory, but, due to data imperfections, they are not. Thus, there is a statistical discrepancy, the same as the one shown in Table I.1.

Changes in non-financial assets, i.e. gross fixed capital, are normally positive. It must be noted, however, that this item is measured gross, i.e. no deduction has been made for depreciation.

Changes in financial assets were negative until 2003/04 and have been positive since then, mainly due to increases in the deposits with the Central Bank. Changes in liabilities, on the other hand, have fluctuated over the last ten years.

Public debt (Table I.5-6)

Public debt reached a peak in 2001 when it surpassed GDP. It has thereafter declined both in value terms and as a percentage of GDP. In 2007 public debt was 42% of GDP. See Figure 1.4.

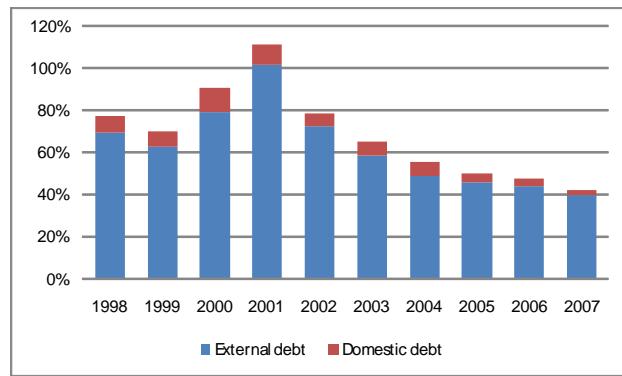

Figure I.4 Public debt, per cent of GDP

The foreign debt service is the amount that government pays on its foreign debt. It is often measured as the proportion of the debt service over foreign exchange earnings. Two can be used as illustrated in Figure I.5, namely public debt as per cent of:

- exports of goods and services; and
- exports of goods and services *plus* labour and property income from foreign countries.

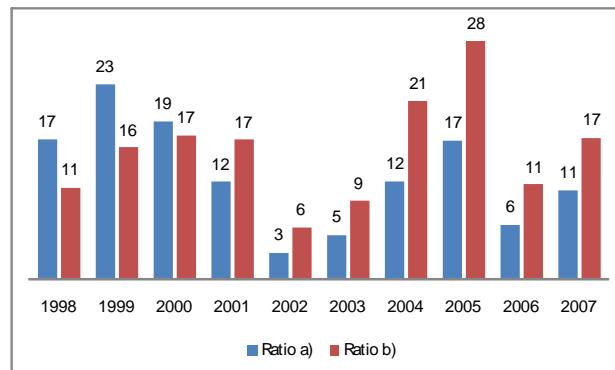

Figure I.5 Debt service ratio, per cent

Government's claims on the banking system (Table I.7)

The bulk of government's financial assets are deposits with the Central Bank, which exceeds liabilities to the Bank. On the other hand, government's liabilities to the commercial banks exceed their deposits (except for 1998). Figure I.4 illustrates the net claims of government on the banking system: positive on the Central Bank and negative on the commercial banks.

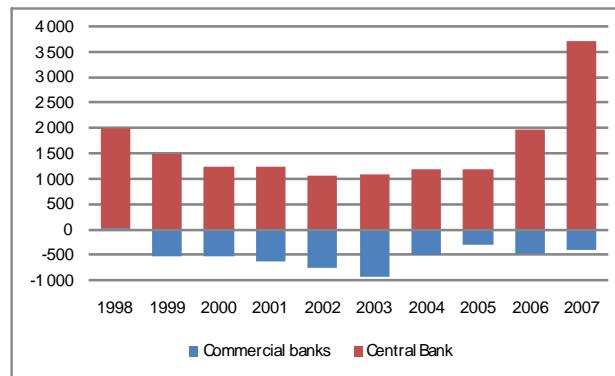

Figure I.6 Government's net claim on banks, million M

About the statistics

The statistics on money and banking are compiled and published by the Central bank of Lesotho from the returns submitted by the commercial banks and other financial institutions operating in Lesotho. Detailed banking statistics are published in the Quarterly Review of the Central Bank, while summary tables are published in the Bank's annual reports.

The banking sector in Lesotho comprises the Central Bank and four commercial banks, namely Standard Lesotho Bank, Nedbank Lesotho, First National Bank of Lesotho and Lesotho Postbank. In addition, there are some enterprises that offer personal loans as well as credit unions.

Monetary survey (Table J.1)

The composition of money supply has changed from 1998 to 2007 as illustrated in Figure J.1. Narrow money comprises cash and demand and call deposits while quasi-money comprises time and savings deposits. Narrow money has gradually increased its share of money supply from 56% at the end of 1998 to 76% at the end September 2008. The average annual increase was 13.5% and 3.7% for narrow money and quasi-money respectively.

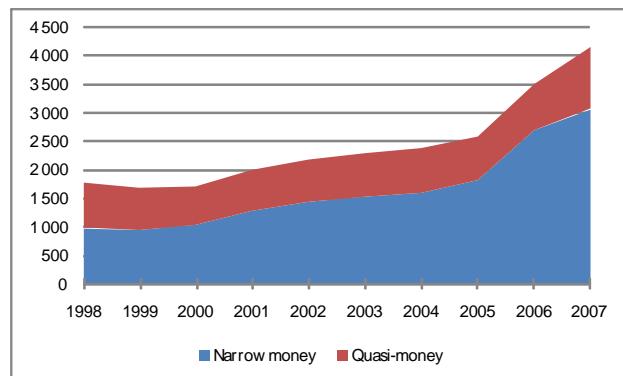

Figure J.1 Money supply, million Maloti, end of year

The credit to households has increased dramatically since 1998, on average with 40% per year from December 1998 to December 2007 — much more than the average inflation rate at 7%. The credit to business enterprises, other entities in the private sector and statutory bodies has increased much less. Credit to households as a share of total credit to the private sector has increased significantly, from 9% at the end of 1998 to 52% at the end of 2007.

The net foreign assets of the banking system has increased an annual average of close to 10% from 1998 to 2007, more for commercial banks (22%) than for the Central Bank (7%), which held 89% of the foreign assets at the end of 1998 compared to 73% at the end of 2007.

Balance sheets (Table J.2-3)

The credit to deposit ratio seeks to establish how much credit is extended to the private sector and statutory bodies using the deposits of these sectors with the banking system. It thus assesses the degree to which the financial sector mobilises deposits from surplus sectors and allocates these funds to deficit sectors. The ratio fluctuated between 20 and 25% from 1998 to 2004 and increased to 37% and 33% at the end of 2005 and 2007 respectively. See Figure J.2.

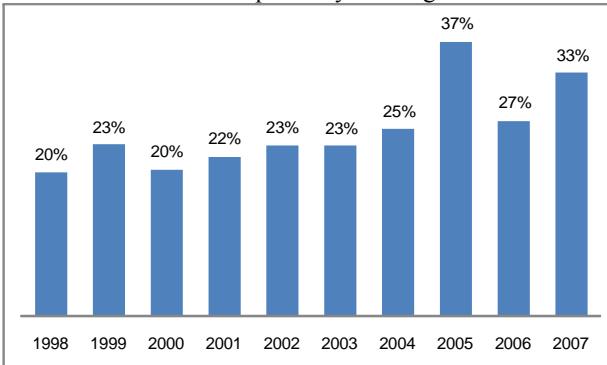

Figure J.2 Credit to deposit ratio

A higher credit to deposit ratio indicates that commercial banks use a relatively larger amount of their deposit liabilities to finance credit.

Interest rates (Table J.4)

Major money market rates in Lesotho have generally followed South African trends as illustrated in Figure J.3. The prime lending rates of Lesotho and South Africa have followed each other closely from 1998 to 2007.

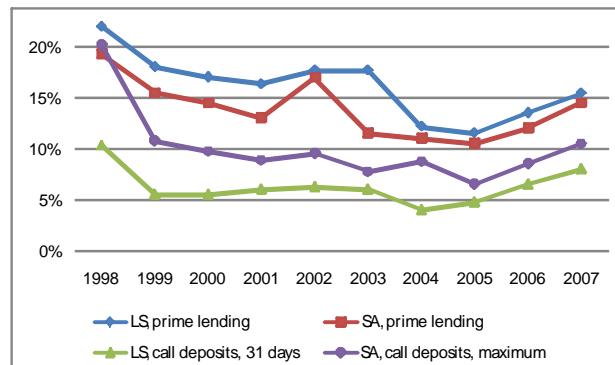

Figure J.3 Interest rates, Lesotho and South Africa

Similarly, deposit rates of commercial banks have, by and large, followed trends in South Africa.

Table K.5c Consumer price index by main group by month, April 1997=100 – 2008	65

About the statistics

The consumer price index (CPI) measures changes in the prices of a selected basket of goods and services as determined for the base period, which is April 1997. Before 2002, prices were collected quarterly in six towns: Maseru, Botha-Bothe, Leribe, Teyateyaneng, Mafeteng and Mohale's Hoek. Prices are collected monthly from 2002 with an addition of two towns: Maputsoe and Quthing. For that reason, the indices are not entirely comparable between 2001 to 2002. The classification in groups was also made more detailed from 2002 in order to comply with international recommendations.

CPI, all items and inflation rate (Table K.1-2)

The inflation rates in Table K.2 are calculated as “Month on the same month during previous year”. That is, the index in a particular month is compared with that of the corresponding month in the previous year. This method tends to eliminate any possible seasonal effects, since the indices for the corresponding months are compared. Nevertheless, the inflation rate may fluctuate considerably.

Lesotho imports the major part of its consumer goods from South Africa and, besides, the currency, Loti, is at par with the South African Rand. Therefore, it can be expected that the inflation rate in Lesotho mirrors South Africa as illustrated in Figure 1

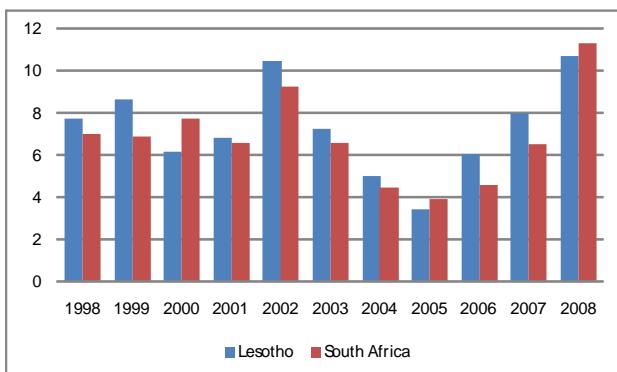

Figure K.1 Inflation in Lesotho and South Africa

Lesotho's inflation rate is slightly higher than South Africa's except for 200 and 2005. One reason is different weights – food, for example, has a higher weight in Lesotho's CPI. The inflation rate shows a peak in 2002 for both countries. The major contributor to this increase was the price increases for staple food such as maize meal. Thereafter, the inflation rate decreased significantly during three years (2003-2005) with a low 3.4% for Lesotho in 2005. In 2006 the inflation rate started to increase, growing

steadily throughout 2007 and 2008 with a high 12.1% in September.

CPI by main groups (Table K.3-4)

As evident from Table K.3, the weight of food in the CPI is close to 40%. Thus, the change in food prices has a significant impact on the overall CPI. This is illustrated in Figure K.2.

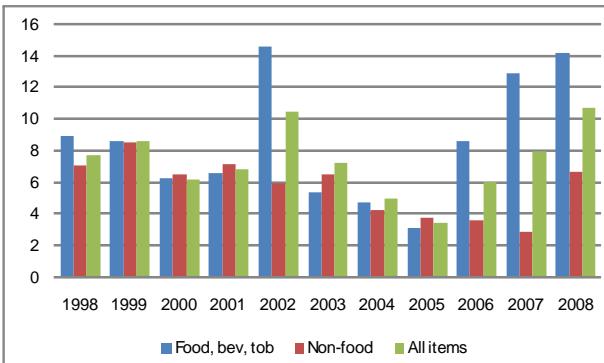

Figure K.2 Food and non-food inflation

The high inflation rates in 2002, 2006 and 2007 were due to significant increases in food prices.

Monthly CPI in 2006 and 2007 (Table K.5)

Table K.5 shows the CPI by main group for 2006, 2007 and 2008. As shown in Figure K.3, the gap between relative prices of food and non-food have been widening since January 2006. Food prices increased with 41.4% from January 2006 to September 2008, while the increase in non-food prices stood at 13.9% during the same period.

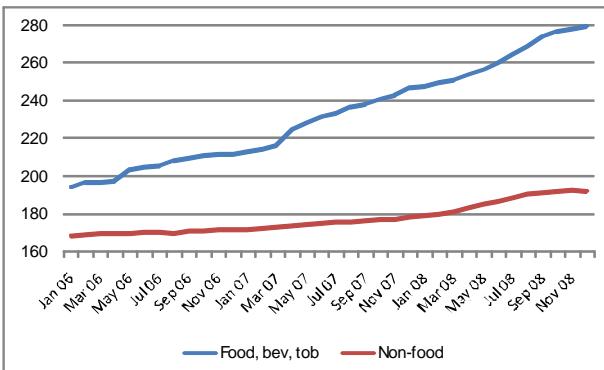

Figure K.3 Food and non-food CPI 2006-2008

About the statistics

The Bureau of Statistics conducted a labour force survey in June 2008 of a representative sample of households. Preliminary results are presented here in Table L.1-3, which show the employment status in the week before the survey was taken. Respondents who reported that they had worked at least one hour that week are defined as currently employed. This includes also subsistence farming. All persons aged six years and above were asked about their employment status.

The other tables in this chapter are based on administrative data.

Employment and unemployment (Table L.1-2)

Table 1 and 2 show the results for persons aged 15 years and above. This is an internationally recommended age limit for the definition of the working age population.

Another term for labour force is *economically active persons*; these are either currently employed or looking for employment. The latter are said to be currently unemployed.

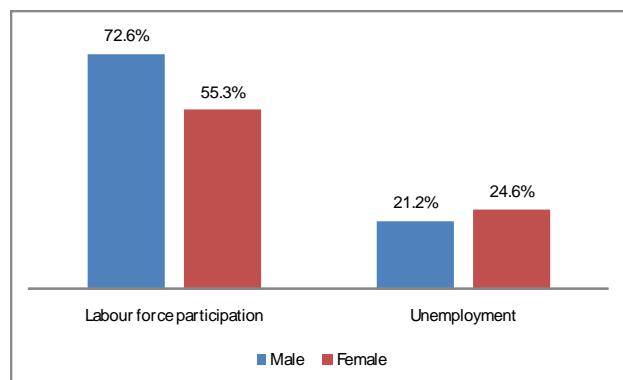

Figure L.1 Labour force participation and unemployment rates

The labour force participation rate is defined as the ratio of the labour force to the working age population, expressed in percentages. According to the survey, this rate was 63.5%. It was much higher for men, 72.6 %, than for women, 55.3%.

The unemployment rate was 22.5%. This is the proportion of currently unemployed over the economically active population aged 15 years and above. The unemployment rate was significantly higher for women, 24.6%, than for men, 21.2%. All in all, close to 180,000 persons were unemployed.

The unemployment rate varies for the districts, from 17.5% in Qacha's Nek to 27.1% in Quthing. See figure L.3. Like the national average, the unemployment rate is higher for women than for men in all districts.

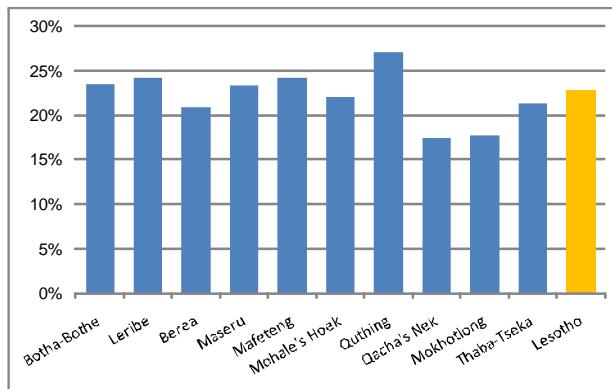

Figure L.2 Unemployment rates by district

Employment by sector (Table L.3)

Table 4 shows employment by major sectors for all persons aged fifteen years and above. Subsistence agriculture employs about 41% of all employed persons. Private households are an important source of employment with about 22% of the total. Included here are persons working in small scale household enterprises as well as domestic servants. See figure L.3.

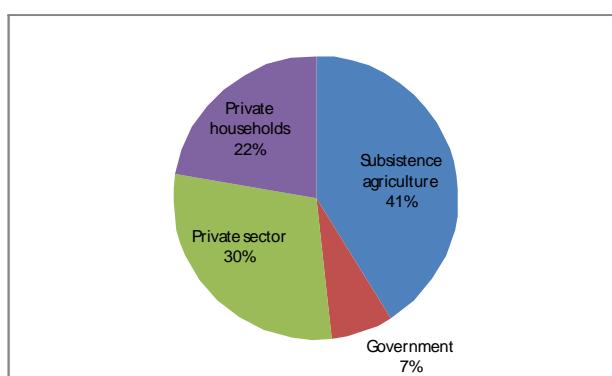

Figure L.3 Employment by sector

Child labour (Table L.3)

As mentioned above, all persons aged six years and above were asked about their employment status. The purpose was to measure the occurrence of child labour; persons aged 6-14 years are considered children

According to the survey, about 3% of children aged 6-14 years were currently employed. About 70% of these children were engaged in subsistence farming, while the rest was

engaged mainly in private households. Child labour is much more common among boys than among girls. This is true regardless of the sector of employment.

Major sources of formal employment (Table L.4-5)

There are three major sources of formal employment in Lesotho: South African mines, LNDC assisted companies and Government. The number of migrant mine workers have decreased from about 80000 in 1998 to about 53000 in 2007. This continues the trend from earlier years; the number of migrant mine workers reached a peak of close to 126500 in 1990 and has decreased ever since. The number of government employees has increased with about 5000 since 1998 and stood at about 48000 in 2007. The employment in LNDC-assisted companies reached a peak in 2003 with more than 51000. It has since declined and was slightly more than 44000 in 2007. The major part of the LNDC-assisted employment is in the clothing and textiles industry.

The average earnings of migrant mine workers include overtime payments and repatriation allowances; they have increased steadily □ the annual average increase was 10.5% during the years 1998-2007.

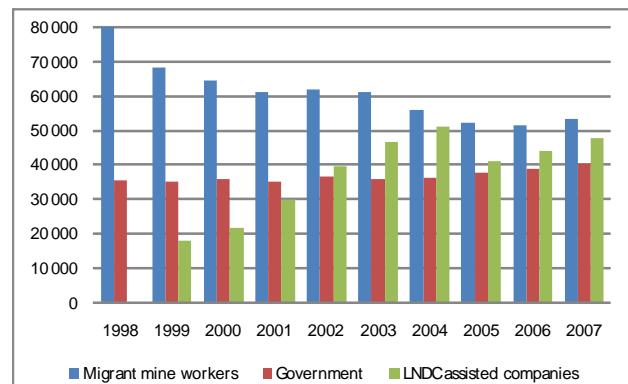

Figure L.3 Major sources of formal employment

National Employment Service (Table L.6-8)

Tables L.4-5 contain data on job seekers, work permits and work related accidents reported by the National Employment Service, while Table L.6 shows minimum wages for different categories. These categories changed from 2003 to 2004, but three categories seem to be comparable over the whole period displayed in Table 6a and 6b, namely security guards, small business workers and domestic servants. The annual average increase for these categories was all in between 6.5 and 7% during the years 1998-2005. This is roughly equal to the average annual inflation rate during these years.

Table M.3 Post-secondary education – enrolment and teachers	73
Table M.4 Primary education – enrolment by grade and sex; passes	74
Table M.5 Secondary education – enrolment by grade and sex; passes	75

About the statistics

Data on enrolment, collected by the Ministry of Education, is the source for the tables in this chapter. As data collection from level 0 centres has just begun there are no tables for this level. Furthermore, there are no data on schools that are not registered with the Ministry of Education.

Education system and policies

The government policy with regard to the educational structure is to have ten years of basic education: seven years of primary education and three years of lower secondary education. This policy is still being implemented.

The primary education and the lower secondary education programmes are structured according to the International Standard Classification of Education according to which the education programme is the unit of classification called level. Each level may have more than one stage, and a successful completion of one stage leads to the next and higher stage. Accordingly, there are six distinct levels of education: 0) Early childhood care and development education; 1) Primary education (Standard 1-7); 2) Lower secondary education (Form A-C); 3) Upper secondary education (Form D-E); 4) Post-secondary non-tertiary education; and 5) University education.

Primary education (Table M.1 and 3)

The number of children enrolled in primary education increased with about 17% from 1994 to 2003, while the increase in the number of teachers was about 25%. Thus, the pupil/teacher ratio improved slightly, from 49 in 1994 to 46 in 2003. The sharp increase in enrolment in 2000 – 75% – is because free primary education was introduced in that year.

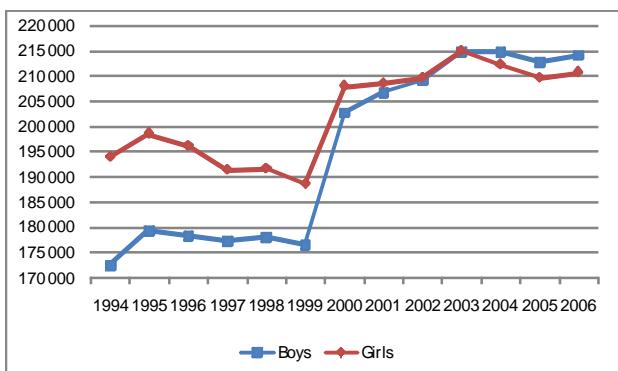

Figure M.1 Enrolment in primary education

Traditionally, more girls than boys have been attending school. Boys in the rural areas were taking care of animals instead. This has changed during the latest ten years; there have actually been slightly more boys enrolled since 2004.

Data on passes in the Primary School Leaving Examination are available from 2000. The pass rate has varied between 73 and 86%.

Secondary education (Table M.2 and 4)

The number of children enrolled in secondary education increased with about 35% from 1994 to 2003, while the increase in the number of teachers was roughly the same 34%. Thus, the pupil/teacher ratio has remained stable at 24 students per teacher.

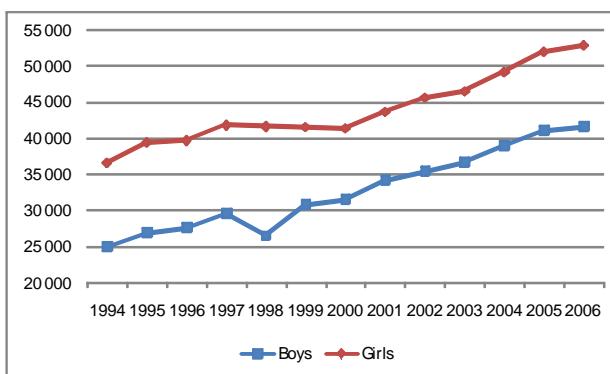

Figure M.2 Enrolment in secondary education

More girls than boys are attending secondary school. Unlike primary schools, the gap has been fairly constant over the last ten years with the share of girls varying between 55 and 60% and that of boys between 40 and 45%.

Data on passes in the examinations are available from 2002 Junior Certificate (JC) is awarded after grade C. The pass rate has varied between 58 and 67%. On the other hand the pass rate for Cambridge Overseas Scholl Certificate (COSC) has been gradually improving from 44% in 2002 to 51% in 2006.

Post-secondary education (Table M.3)

Number of teachers and students are provided for the National University of Lesotho, the College of Education (teacher training) and technical and vocational training provided by the Lerotholi Polytechnics. Other institutes, such as the Institute for Accounting Studies, also provide vocational training. However, data have not been available.

N. Health and Medical Care

List of tables

Table N.1 Reported number of health personnel	77
Table N.2 Immunisation	77
Table N.3 Reported number of deliveries by type	77
Table N.4 Place of delivery	78
Table N.5 HIV prevalence	79

About the statistics

The Ministry of Health and Social Welfare, through the Department of Health, Planning and Statistics, collects health data from all health facilities that are operated by the Government and Christian Health Association of Lesotho (CHAL). Most data are collected on a monthly or quarterly basis. Data on health infrastructure, however, are collected on a monthly or quarterly basis. There are serious delays in the processing and analysis of the reported data and also with the consistency in the reporting by various health facilities. Therefore, only a few tables are included here. Even so, some of the changes from year to year may be due to changes in reporting.

In addition to administrative data, two tables are included from the 2004 demographic and health survey providing information on birth deliveries and HIV/AIDS.

Health personnel (Table N.1)

Table N.1 shows the number of health personnel reported by government and CHAL hospitals and clinics. While the number of medical doctors seems to have been fairly stable from 2002 to 2005, the number of nurses increased substantially during the same period. The number of nursing assistants also increased but to a lesser extent. The significant increase from 2001 to 2002 is to some extent due to improvements in the reporting.

Immunisation (Table N.2)

As shown in Table N.2 the number of BCG, DPT, and Polio immunisations reported by government and CHAL hospitals and clinics increased steadily from 2001 to 2005. DT immunisations, which differ from DPT by not including whooping cough, are not reported since 2004. Immunisation against hepatitis B was introduced on a broad scale in 2003 and 2004, hence the steep increase from 2003.

Child deliveries (Table N.3-4)

Table N.3 shows that the number of deliveries reported by government and CHAL health facilities increased from a bit more than 16,000 in 2001 to close to 21,000 in 2005. This does not include deliveries in private health facilities, which are likely to be few. According to the Demographic and Health Survey 2004 (Table N.4), 52.4% of all deliveries took place in health facilities. Out of the total number of deliveries, only 1.7% were carried out in private facilities. The proportion of deliveries taking place in health facilities:

- increases with the level of the mother's education;
- increases with the wealth of the mother;
- increases with the number of antenatal care visits;
- is much higher in urban than in rural areas;
- decreases with the mother's age at birth; and
- decreases with the number of children the mother has.

Furthermore, the proportion of deliveries in health facilities was between 50 and 55% in all districts except Maseru, where it was just above 60% and Mokhotlong and Thaba Tseka, where it was a between 37 and 40%. This tallies with the low percentage in the mountain zone, about 33%.

HIV/AIDS (Table N.4)

The proportion of HIV-positive people was 23.5% according to the Demographic and Health Survey 2004. It is higher for women, 26.4%, than for men, 19.3%

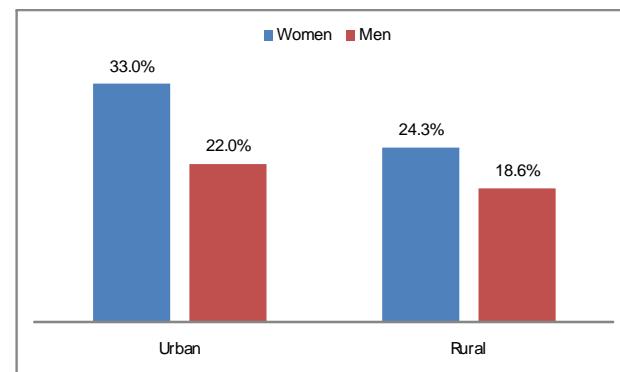

Figure N.1 HIV prevalence by urban/rural and sex

The proportion of HIV-positive persons is higher in urban areas compared to rural areas for both women and men,

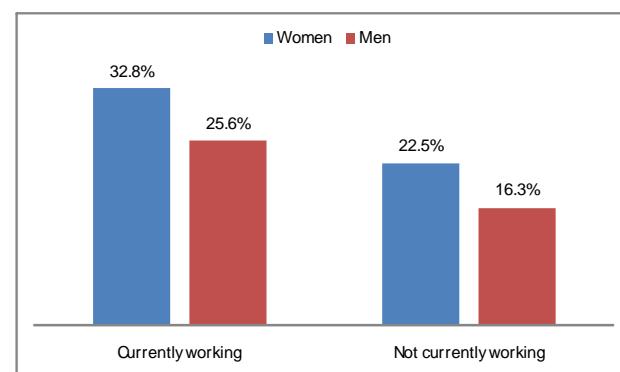

Figure N.2 HIV prevalence by employment and sex

The proportion of HIV-positive persons is higher for those who are currently working compared to those who are not working.

About the statistics

The statistics in this chapter are, with one exception (Table O.5), based on administrative data collected by the Department of Police (crime) and the Department of Correctional Services. Thus, the occurrence of crime reflects the crimes that have been reported to the Police. The data on personal safety, however, are from the Household Budget Survey that was conducted in 2003 and gives a perspective on crime from the point of view of the households.

Reported cases of crime (Table O.1-4)

Reported crimes are categorised by the police in three major groups: serious, common and other; the sub-categories are clear from Table O.1. Cases of serious crimes have fluctuated between about 13000 and 17500 per annum from 1997 to 2006. There is, however, an upward trend as illustrated in Figure O.1

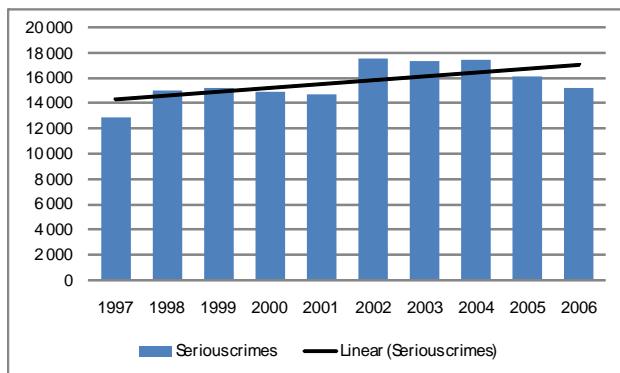

Figure O.1 Cases of serious crime, 1997-2006

The two most frequently reported kinds of serious crimes are house breaking and stock theft accounting for 31 and 25% respectively in 2006.

About one third of the serious cases of crime are reported in the Maseru district (Table O.2 and Figure O.2). The cases per district broadly follow the size of the population. However, the reported cases per 1000 persons are twelve for Maseru, higher than for any other district.

Reported cases of traffic offenses have dropped sharply from 2002 (close to 50000) to 2006 (close to 14000). This mainly reflects changing routines of the police.

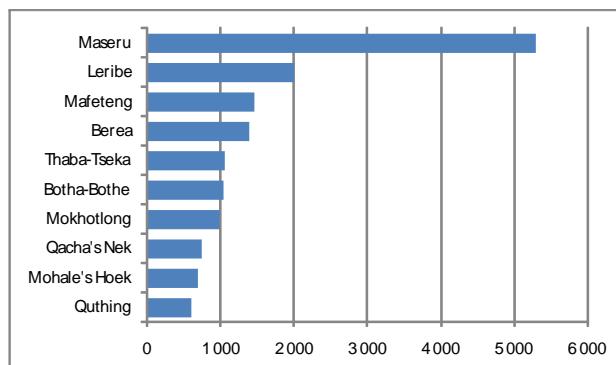

Figure O.2 Cases of serious crime by district, 2006

Personal safety (Table O.5)

The 2003 Household Budget Survey included a Living Condition Index (LCI) module, which was administered to persons aged fifteen years and above. Individuals were requested to rate each question from one to ten, based on their level of satisfaction for the item being considered; with one, meaning not satisfied at all and ten, meaning fully satisfied.

One of the LCI-modules dealt with personal safety. Table O.5 shows that, in general, household members perceive personal safety categories to be satisfactory with a national average of 5.08. The average score varies positively with the income quintile, i.e. higher incomes means a higher average rating of personal safety.

Correctional services (Table O.6□8)

The data on correctional services do not seem to be internally consistent and should be treated with care.

The prison population has been between 2500 and 3500 for the years 1998-2005. It increased in 2006 and was close to 5000 at the end of the year. Women make up less than 5% of the prison population.

As can be expected, the majority of persons received at prisons have committed crime against person (45-50%) or property (about 40%).

Most persons received at prisons have no or only primary education, between 70 and 80% since 1998. That is roughly the same as the share of the total population with no education or only primary education.
